3. The gods. 3. Magic, divination, and . 4. Altars and temples. 3. Magic, divination, and . 5. Tablets and papyri. 3. Greek mythology. I. Parin, Ingrid. Title. KNX573.A93 2012 ; 51.8'17" The TLC plant (*Tetragastis-lycopersicola*), a mutualistic plant pathogenic fungus of the section *Trenchii*, was used in the production of a biosimilar inulin produced by the process of acid hydrolysis and enzymatic enzymatic hydrolysis \[\[ @CR35], [ @CR37], [ @CR38]\]. The comparison of the two processes was of particular interest because of its expected advantages, such as reduced cost, a high product yield and much lower by-product formation \[\[ @CR39], [ @CR40]\]. The chromatographic fingerprinting performed with the HPLC method showed three peaks (A, B, and C) in the chromatogram. Peak C, which appeared later than peak B in the reaction, was not found in the control. Furthermore, peak C, which had the same retention time as the inulin standard, was not found in the reactions with the TLC

---

plant. Peak B was not found in the reactions with the inulin standard. Both the chromatograms with the standard inulin (as shown in Fig. [1](#Fig1){ref-type="fig"}) and the chromatograms with the inulin produced by the reaction of the TLC plant were identical. The HPLC profile of the reaction products of both the enzymatic and the TLC hydrolysis processes of inulin are shown in Fig. [2](#Fig2){ref-type="fig"}. The two peaks (A and B) had the same retention time in the reactions with the TLC plant. They also had the same retention time as those of the standards, with the exception of peak B, which was observed only in the reactions with the standards. Since the inulin standard was not hydrolyzed and was not present in the reactions with the TLC plant, we conclude that these two peaks belong to inulin. This means that the process in which the TLC plant was used as a source of inulin production by the process of acid hydrolysis and enzymatic enzym 82157476af
